

Abstract

The tool mounted in a body of an apparatus is retained by a cotter engaging inside a notch of the tool, the cotter being engaged in a borehole of the body. The area of the body containing this borehole for engagement of the cotter is equipped with a covering ferrule. This ferrule is provided for occupying a first position in which it at least partially occludes the borehole and a second position in which the borehole is cleared for enabling the cotter to be inserted or removed.
